

Whitepaper v2.0

Goidr

goidr.co.id

Abstract

Gold Indonesia Republic (GOIDR) was established with its main mission to digitize and mobilize Indonesia's gold assets, making those accessible across the globe. Our vision is we want to make gold move with ease globally, 24/7, and without friction or boundaries. We envision gold as an ideal asset due to its uniqueness, high market demand (with a market value exceeding US\$9 trillion), and resilience against inflation. However, physical gold is somewhat complex and is expensive to own, store, and transfer.¹

GOIDR aims to bring unprecedented efficiency, security, convenience, and trust to own and trade gold assets in the digital environment. GOIDR provides a solution that allows gold to be traded fractionally on crypto exchanges. In this case, GOIDR functions as a digital gold savings in the form of a crypto asset (stablecoin), which can be exchanged for another digital asset on supported exchanges or redeemed for physical gold under specific terms and conditions. Like any other stablecoin, GOIDR serves as a "safe haven" asset, which makes it appealing for investors who prefer to store value in a less volatile form.

1. Brief History of Gold

Historically, gold has played a significant role in the global financial system. Despite its rarity, physical gold is chemically stable, easy to shape, and universally valued. It has preserved its worth for thousands of years and remains highly popular with an average daily trading volume reaching US\$112,2 billion—through ETFs, derivatives, and physical markets.²

Even during times of global conflict, gold remains a safe haven asset. It is widely recommended around the world as part of a diversified investment portfolio and is often preferred over local fiat currencies, especially those who are living in countries with an unstable monetary system.

Currently, the gold market faces a contradiction: there is no physical gold that is easy to own or trade. While it is possible to own a large portion of gold, it is expensive to store and impractical to transport—making it challenging to trade, especially in the case of peer-to-peer trading. As an alternative, investors can still trade in digital gold and gold ETFs.

² “Gold Market Structure and Flows”. World Gold Council. <https://www.gold.org/about-gold/market-structure-and-flows>. August, 30th 2019.

2. Web 3.0 Gold

2.1 Gold as Digital Asset

In Indonesia, regulations regarding digital financial assets fall under the jurisdiction of the Financial Services Authority (OJK). Digital financial assets are a new class of assets that classify as an asset that are traded entirely in digital form. Cryptocurrencies and its derivatives are included in this sector.

Cryptocurrencies have seen rapid growth in Indonesia since 2019. However, there is no digital financial asset that is backed by physical gold available in the market. Most digital assets currently offered on local crypto exchanges are in the form of utility tokens, security tokens, and stablecoins pegged to fiat currencies such as USD and IDR. GOIDR is set to become the first gold-backed stablecoin in Indonesia.

2.2 Current Gold Market Challenges

The majority of processes involved in buying, selling, and settling gold transactions remain manual, outdated, and often lack of transparency. This heavy reliance on manual operations leaves room for human error and can significantly disrupt market efficiency.

Moreover, the nature of gold—its size and mass—poses a fundamental challenge in itself. Transporting physical gold is logistically difficult, and storage costs are relatively high, making gold investments feel impractical for many investors.

2.3 Buying and Selling Gold

There are several ways to obtain investment-grade gold: over-the-counter trading, gold exchange-traded funds (ETF), gold futures, and retail gold outlets.

One of the most dominant companies in Indonesia's gold industry is none other than a state-owned company that revolves around both bullion bank and jewellery. This company offers gold sales, multi-financing, gold pawning, gold storage services—in both conventional and sharia manner—which makes them a major player in the country's gold industry.

3. GOIDR

Figure 1. GOIDR Logo

GOIDR is a digital asset in which one token represents one gram (1 gr) of physical gold that is securely stored in the vaults of a licensed gold custodian in Indonesia. Owning any amount of GOIDR is basically equivalent to owning physical gold held under custody. Accordingly, the value of GOIDR directly reflects the gold price set by the custodian.

GOIDR is built on top of the Polygon network and follows the ERC-20 standard, making it compatible with all Ethereum-based wallets. All transactions are executed based on our smart contracts. These smart contracts ensure that all activities—including transactions, verification, and validation—are operated automatically, minimizing human error and providing transparency through blockchain explorer.

Like any other crypto asset, GOIDR is available 24/7, enabling real-time transactions between users. Unlike traditional gold, which is only accessible on business days during business hours, GOIDR can be transacted at any time, fully digitally.

3.1 Core Product Benefits

GOIDR can be bought fractionally as minimum as 0,0001 on our crypto exchange partners. By leveraging blockchain technology, GOIDR makes gold trading significantly easier and faster than ever before.

Users can redeem their GOIDR for physical gold – with a minimum redemption of 1 gram – at the outlet of our gold custodian institution partner. Redemption requests can be made through the GOIDR wallet accessible at <https://wallet.goidr.co.id/>.

GOIDR was established through a collaboration between PT Indonesia Blockchain Persada (PT IBP) as the token issuer, with a state-owned company serving as the physical gold vault provider.

Given GOIDR's entry is extremely low, fractional gold ownership becomes accessible to a broad range of users. Investors can own GOIDR through crypto exchanges and store it in their GOIDR Wallet provided by us.

Compared to traditional gold, GOIDR offers a much lower cost structure. Unlike conventional gold savings, those who own GOIDR on the GOIDR Wallet are not subject to storage fees. GOIDR charges minimal fees, limited only to blockchain transactions in the form of gas fees.

Through both local and international crypto exchanges, GOIDR can be traded with fiat and other crypto asset pairings. Our vision is to make GOIDR tradable on a global scale.

3.2 GOIDR Use Cases

In the near future, users can expect to utilize a wide range of GOIDR use cases exclusively available on our Wallet. Here are some upcoming features planned in our roadmap:

a. GOIDR Pawn

GOIDR Pawn allows users to obtain a short-term loan using GOIDR as collateral. In this mechanism, users must hold a minimum GOIDR amount before being eligible for financing.

b. Gold Auction

Separated from our wallet, we plan to launch a digital auction of pawned jewellery held by our gold custodian partner. The auction process will be executed in the form of Non-Fungible Tokens (NFTs), where each precious item will be unique, representing its value backed by the real jewellery.

c. Staking

We are also planning to bring staking through the GOIDR Wallet. Staking allows users to lock their GOIDR token for a determined period to potentially earn yield. The value of the return will fluctuate in accordance with the gold market.

3.3 GOIDR Roadmap

In this section, we elaborate on the GOIDR roadmap, explaining both short-term and long-term strategies for the development of the GOIDR ecosystem. We will also present a business model that ensures the sustainability and growth of GOIDR, including market expansion to both local and global crypto exchanges.

a. Short Term

GOIDR Minting dan Burning

Minting and burning mechanism of GOIDR is implemented to maintain a balance between supply and demand based on market needs. The GOIDR minting process begins with the physical gold stored and documented by our custodian partner through a formal custody report. Based on those activities, we will mint the GOIDR token in accordance with the stored gold amount. The total GOIDR supply is transparent and is visible in real-time through our contract address and our official website.

On the other hand, the GOIDR burning process requires a redemption before the token is burned. Each GOIDR token that has been redeemed for physical gold will

be subject to a burning process. All redemption transactions (burning) are automatically written on the blockchain, ensuring that the circulating supply of GOIDR remains consistently backed by 1:1 physical gold.

GOIDR Conversion to Rupiah or any other digital financial assets

Shortly, GOIDR will be convertible to IDR and any other digital financial assets through crypto exchanges. This feature will give users a convenient way to trade with GOIDR.

GOIDR Conversion to Physical Gold

We have partnered with PT Pegadaian Galeri Dua Empat (Galeri24) to facilitate the redemption of GOIDR. As mentioned in the core product benefits, users who hold a minimum amount required will be eligible to make a redemption request through our wallet. Once a redemption request is submitted, the GOIDR balance on your account will be locked.

For the time being, the physical gold can only be collected in Indonesia, specifically at Pegadaian Ps. Senen Branch, located at Jl. Senen Raya No.36, Senen, Central Jakarta.

b. Long Term

GOIDR Pawn

GOIDR users will be able to use their GOIDR tokens as collateral to obtain short-term loans at competitive interest rates. During an active pawning period, the user's collateral assets will be locked through the GOIDR wallet mechanism and will be subject to liquidation should the user fail to repay the principal along with the applicable interest.

The implementation of this token pawning feature is planned to be carried out in direct collaboration with the bullion bank ecosystem that has also partnered with

GOIDR. Through this partnership, users will gain access to a more regulated and trustworthy pawning mechanism.

The pawning application process is accessible exclusively through the GOIDR Wallet. Once your account has been verified, the pawning request will be available and the loan funds will be disbursed in accordance with the approved collateral value.

The loan amount on the GOIDR Wallet is determined based on the applicable loan-to-value (LTV) ratio, with flexible loan tenors available to accommodate each user's needs. Users are required to repay the loan principal and interest in full prior to the due date in order for the pledged GOIDR tokens to be fully returned.

Staking

The staking option enables users to earn returns by locking their GOIDR tokens, with the yield value determined based on a predetermined interest rate. Staking serves as a passive income alternative to other instruments, simply by holding GOIDR in our wallet.

Through our collaboration with the bullion bank ecosystem, we are able to offer competitive interest rates and income potential compared to conventional instruments. As an illustration, a user who locks 1,000 GOIDR for a period of six months will be entitled to receive yields in accordance with the interest rate applicable during that period.

To initiate staking, users select the amount of tokens they wish to stake, determine the staking period, and confirm the transaction. Throughout the designated period, GOIDR tokens may not be transferred or redeemed for physical gold. Yields are then automatically credited upon the conclusion of the staking period.

We will provide a range of staking period options to best serve the varying needs of our users — from shorter tenors for those seeking faster liquidity, to longer tenors for those looking to maximize their potential returns.

Global Exchange Listing

We are planning to expand GOIDR's reach to a global scale by getting listed on major crypto exchange players around the world. This market expansion will enhance GOIDR's liquidity as a stablecoin. Additionally, our sustainable business model offers multiple revenue streams that support the long-term viability of the ecosystem.

Through this roadmap, we aim to build a robust ecosystem, deliver value to all GOIDR holders, and fulfill our vision of enabling gold ownership fully digitally.

3.4 GOIDR Architecture

The transaction process within the GOIDR system is fundamentally divided into token minting and burning. These processes played a key role in maintaining price stability by balancing the supply and demand of circulating GOIDR.

Each minting and burning activity follows a periodic consolidation conducted by us in coordination with our gold custodian partner. This ensures that the total supply of GOIDR will always be mirrored with the amount of gold stored in the custody.

a. Technology Stack

In the development of GOIDR, several technologies are used to support the GOIDR function and features. The diagram below illustrates the core technologies integrated into the GOIDR ecosystem.

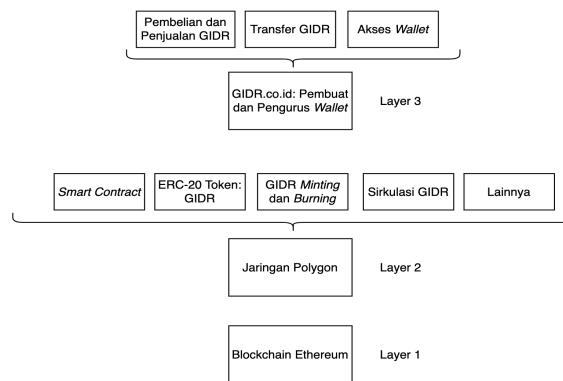

Figure 2. GOIDR Technology

b. GOIDR Minting dan Burning

GOIDR minting refers to the process of creating new tokens on a blockchain network. Minting is similar to the concept of “printing money” in traditional financial systems—it involves the issuance of new tokens into circulation.

The GOIDR minting process is typically executed by a blockchain protocol or a predefined smart contract. Once tokens are minted, they are officially added to the circulating supply within the network.

On the other hand, token burning is the permanent removal of a token from the blockchain. The main objective of this is to reduce the total circulating supply and often to increase the relative value of the remaining tokens or to stabilize the token’s market price.

Token burning generally involves sending tokens to an inaccessible address, often referred to null address. GOIDR sent to this address are considered destroyed and cannot be recovered.

Diagram below provides an explanation of the GOIDR minting and burning process.

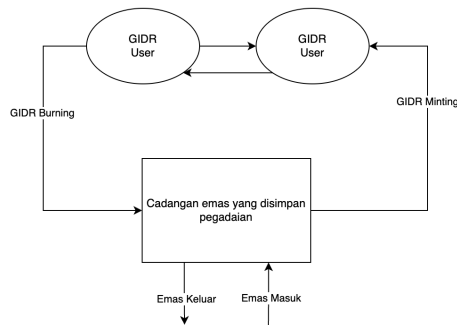

Figure 3. GOIDR Token Minting & Burning

4. GOIDR Operational

GOIDR is an ERC-20 token issued by PT IBP and backed by physical gold stored by a licensed gold custodian. As an ERC-20 token, GOIDR operates through a smart contract that adheres to the standard protocol representing a token on the blockchain.

Specifically, an ERC-20 smart contract must declare the token's core attributes (name, symbol, and decimal precision), track the total token supply, monitor token balances, and allow holders to transfer to other addresses.

The gold custody reports that serve as the underlying value of GOIDR are publicly accessible and will always be available on our website. Additional details about GOIDR can be found through our contract address:

0x0a40ff165736f5989e9F40fFbEd24A640c760754.

4.1 Fees

GOIDR applies a fixed fee for all on-chain GOIDR transfers made through our wallet. We are committed to producing transparency to our users and will not alter the fee without prior notice.

4.2 Identification

Before users can access the full features of GOIDR Wallet, they are required to complete an electronic Know Your Customer (e-KYC) process. This system enables us to verify users accurately and efficiently.

To support this process, we have partnered with a certified Electronic Certification Provider (PSrE) that utilizes facial recognition technology, referencing directly with the Civil Registry in Indonesia.

This strict identification and verification help protect the GOIDR Wallet ecosystem from potential fraud and ensure our compliance with anti-money laundering (AML) measures. With this secure system, our users can confidently transact and save GOIDR with peace of mind.

4.3 Mechanism and SLA GOIDR Redemption

Users may only redeem GOIDR once their balance meets the GOIDR minimum required. It is important to note that the collection of physical gold cannot be delegated and must be done in person only at Pegadaian Ps. Senen Branch, located at Jl. Senen Raya No.36, Senen, Central Jakarta.

Users with sufficient GOIDR balance may submit a redemption request by selecting a preferred collection date. During the request period, the GOIDR balance will be locked to prevent any unintended token transfers. Once approved, users will receive a QR Code that will be used as a verification method during the gold collection process. On the scheduled date, our team will scan the QR code before handing the gold to our users.

A reminder email will be sent to the users one day before the scheduled date to ensure the appointment is not missed.

Redemption cancellations can only be made not later than one day prior to the scheduled date. After that, the user may submit a new request starting 2 days after the cancellation. Please note that once the physical gold has been collected, it cannot be converted back into GOIDR tokens.

4.4 Partnership

To ensure the availability of physical gold, price references, and to facilitate the GOIDR redemption, we partner with a licensed gold custodian.

Regarding GOIDR exchange, we have partnered with several crypto exchanges in Indonesia. Updates about our partnerships are available on our website.

4.5 Regulatory Oversight and Compliance

GOIDR is committed to giving transparency and operates under oversight from the authorities, particularly regulators in Indonesia. Compliance with applicable regulations is our top priority. PT IBP, as the issuer, with our gold custodian partner, is dedicated to maintaining best governance practices and regulations.

As part of our commitment to transparency and accountability, we will regularly publish a GOIDR Report. This report provides a comprehensive overview of GOIDR's underlying asset, including circulating supply, total supply, and the number of tokens burned. These reports are intended to give the public a clear understanding of GOIDR and its underlying value.

In the interest of regulatory compliance, GOIDR is subject to the regulations of the Financial Services Authority (OJK) as the current regulator for digital financial assets in Indonesia, specifically POJK 27 of 2024 concerning the Organization of Digital Financial Asset Trading Including Crypto Assets. In addition, GOIDR is also included in the Registered Crypto Assets list issued by the crypto exchange in Indonesia.
